Pushdown Automaton (PDA)

1. Read in an input character
- ⊛ 2. Pop a character off the stack
3. Move to a new state
- ⊛ 4. Push a character onto the stack

$$A = \{ \underline{a^n b^k c^n} \mid \underline{n, k \geq 0} \}$$

aaabbbccc

Def. [PDA, Formal]. A Pushdown Automaton is a 6-tuple

$$(Q, \Sigma, \Gamma, q_0, F, \delta) \text{ where:}$$

- Q is the set of states $\{q_0, q_1, q_2, q_3, q_4\}$
- Σ is the input alphabet $\{a, b, c\}$
- Γ is the stack alphabet $\{\$, a\}$ $\{\$, a, b, c\}$
- q_0 is the start state

- F is the set of accept states $\{q_4\}$

- and $\delta: Q \times \Sigma_{\epsilon} \times \Gamma_{\epsilon} \rightarrow \mathcal{P}(Q \times \Gamma_{\epsilon})$ is the transition function.

"give me a state,
an input symbol or ϵ ,
and a stack symbol or ϵ ."

"go to this state
and push this
stack symbol"
"go to these pairs
of (state, push symbol)."

$$\delta(q_1, a, \epsilon) = \{(q_1, a), (q_6, \epsilon)\}$$
